Rancho Suspension Systems:

RS66301B — Fits vehicles equipped with factory forged steel upper control arm
RS66302B — Fits vehicles equipped with factory aluminum or stamped steel upper control arm

2017-2014 GMC Sierra / Chevy Silverado 1500 4WD

Stamped steel upper control arms NOT COMPATIBLE with OE wheels. See page 4

NOT COMPATIBLE WITH 6.2L Engine, or Z95 Magnetic Ride Control

Front Driveshaft Replacement Recommended. See page 4.

— FMVSS 126 Certified —

WARNING

Carefully read, understand and follow the instructions provided in this manual, and keep it in a safe place for future reference. If you have any doubt whatsoever regarding the installation or maintenance of your Rancho suspension system, please see your retailer for assistance or advice. Failure to follow the warnings and instructions provided herein can result in the failure of the suspension system, or can cause you to lose control of your vehicle, resulting in an accident, severe personal injury or death.

These instructions should remain in the vehicle glove box for future reference.
WARNING: READ ALL INSTRUCTIONS THOROUGHLY FROM START TO FINISH BEFORE BEGINNING INSTALLATION. Failure to follow the warnings and instructions provided herein can result in an accident, severe personal injury or death.

PRELIMINARY

This manual presumes that all persons installing this suspension system have a high level of mechanical training and experience, and have available to them all necessary tools and safety equipment. This manual is not and should not be construed as an exhaustive list of all required safety measures. Personnel should rely primarily on their training and experience, as well as on their own common sense. This Manual is to be read as a supplement to, the owner’s manual and/or shop manual that originally accompanied the vehicle. Refer to such use, operation, maintenance and safety manuals as necessary, and especially after installation is complete, to insure proper vehicle operation.

The following terminology has been used in this Manual:

ACCIDENT: Any event which could cause personal injury or death to anyone installing or using the suspension system, as well as to passengers and bystanders, or otherwise may result in property damage.

PRE-INSTALLATION WARNINGS and INSTRUCTIONS

WARNING: Only the following rim/tire sizes may be used with this suspension system: LT325/60R20 tire, 20 x 9-in +10 offset wheel.

Use of any other rim/tire combination increases the risk of a roll-over and/or accident, resulting in severe personal injury or death.

WARNING: This suspension system will enhance the off-road performance of your vehicle. It will handle differently; both on and off-road, from a factory equipped passenger car or truck. Failure to drive this vehicle safely may result in serious injury or death to the driver and passengers. ALWAYS WEAR your seat belts, REDUCE your speed, and AVOID sharp turns and other abrupt maneuvers.

Service and repair tasks require specialized knowledge, training, tools, and experience. General mechanical aptitude may not be sufficient to properly install this suspension system. If you have any doubt whatsoever regarding your ability to properly install the suspension system, please consult a qualified mechanic.

Your brake lines and fuel lines should remain undisturbed during and after installation. If you think you need to modify these components in any way, you are mistaken. You are installing the lift improperly and will be creating a significant risk of an accident. In case of any doubt, consult a qualified mechanic.

If any component does not fit properly, something is wrong. You are installing the lift kit improperly and will be creating a significant risk of an accident. Never modify any component of the vehicle or suspension system, except as instructed herein. Do not continue with installation until you have identified the problem.

Several of the procedures described herein require at least two (2) persons to safely complete the task. If you have any doubt about your ability to complete any operation by yourself, always ask for help from a qualified assistant.

Before starting any operation, confirm that all personal safety devices and safety equipment are in proper condition and position.

Give your work undivided attention. Looking around, carrying on a conversation and "horse-play" are careless acts that can result in an error in installation and/or serious injury.

Install only tires approved by the United States Department of Transportation ("DOT approved"). Make sure the rim and tire size are properly matched.

If any components of the vehicle or suspension system are damaged in any way during installation, immediately replace the component. During installation, carefully inspect all parts of the vehicle and replace anything that is worn or damaged.

Nip points present the risk of the catching, lacerating, crushing and/or amputating fingers, hands, limbs and other body parts during operations. Always keep clear. Wear protective gloves.

Oil and hydraulic fluids are poisonous, dangerous to health and are known to the State of California to cause cancer, birth defects or other reproductive harm. Do not inhale vapors or swallow. Do not allow contact with the eyes or skin. Should any oil or fluids be swallowed or inhaled or come into contact with the eyes, immediately follow the safety precautions on the label or call a poison control center immediately. Should any of the oil or fluids contact your skin, immediately wash thoroughly.

Never install the suspension system if you are under the effects of alcohol, medications and/or drugs. If you are taking prescription or over the counter medication, you must consult a medical professional regarding any side effects of the medication that could hinder your ability to work safely.

AFTER INSTALLATION WARNINGS AND INSTRUCTIONS

After installation is complete, drive the vehicle slowly in an area free from heavy traffic for at least three (3) miles. Likewise, before traveling on any highways or at a high rate of speed, drive the vehicle for ten (10) miles on side roads at moderate speed. If you hear any strange noise or feel unusual vibration, if a component of the suspension system is not operating properly, or if any warning lights illuminate or buzzers sound, stop the vehicle immediately. Identify the cause and take any necessary remedial action.

Confirm that all components of the vehicle, including all lights (headlights, turn signals, brake lights, etc.), linkages (accelerator, etc.), electrical switches and controls (windshield wipers and defoggers, etc.), and other warning devices (low tire pressure monitoring systems) are fully operational.

Your headlights will need to be readjusted before the vehicle is used on the roads. Consult the vehicle owners’ manual.

The speedometer and odometer will need to be recalibrated after installation. See your dealer.

Confirm proper rear view and side view while seated in the driver seat. Install supplemental mirrors as necessary.

Your original low tire pressure monitoring system may be re-installed in your new wheels. However, if you choose to purchase a new system, see your dealer to have them properly calibrated. Proper tire pressure is critical to safe operation of the vehicle.

OPERATION

Because it has been modified, the vehicle will not handle, turn, accelerate or stop in the same manner as an unmodified vehicle. In addition, the crash protection systems designed in the vehicle may operate differently from an unmodified vehicle. For example, turning and evasive maneuvers must be executed at a slower rate of speed. Further, there is a greater risk that the vehicle could roll over. These differences could result in an increased possibility of an accident, personal injury or death. Learn the vehicle’s operations and handling characterizes and drive accordingly.
IMPORTANT NOTES

A. Before installing this system, have the vehicle’s alignment and frame checked by a certified technician. The alignment must be within factory specifications and the frame of the vehicle must be sound (no cracks, damage or corrosion). Have all suspension, steering and driveline components inspected and replaced if worn or damaged.

B. The components of Rancho’s suspension system are designed as a single integrated system. To avoid compromises in terms of safety, performance, durability or function, do not install a body lift kit with Rancho’s suspension system or interchange parts from this system with components from another manufacturer. Use of other components will result in the forfeiture of any type of warranty on the vehicle/suspension system.

C. Some components required for the installation of this kit may need to be purchased separately. See “SPECIFICATIONS & REQUIREMENTS” on next page of this manual.

D. Compare the contents of this system with the parts list in these instructions. If any parts are missing, contact the Rancho Technical Department at 1-734-384-7804.

E. Do not powder-coat or plate any of the components in this system. To change the appearance of components, automotive paint can be applied over the original coating.

F. Each hardware kit in this system contains fasteners of high strength and specific size. Do not mix hardware kits or substitute a fastener of lesser strength. See bolt identification table at end of instruction.

G. Install all nuts and bolts with a flat washer. When both SAE (small OD) and USS (large OD) washers are used in a fastener assembly, place the USS washer against the slotted hole and the SAE washer against the round hole.

H. Apply a drop of thread locking compound to all bolts during installation. CAUTION: Thread locking compound may irritate sensitive skin. Read warning label on container before use.

I. Unless otherwise specified, tighten all nuts and bolts to the standard torque specifications shown in the table at end of instruction. USE A TORQUE WRENCH for accurate measurements.

J. Do not weld anything to these components, and do not weld any of these components to the vehicle unless specifically stated in the instructions.

K. It is extremely important to replace coil springs, axle flanges, and drive shaft/pinion relationships as original. Be sure to mark left/right, front/rear, and indexing of mating parts before disassembly. A paint marker or light colored nail polish is handy for this.

L. Suspension components that use rubber or urethane bushings should be tightened with the vehicle at normal ride height unless otherwise specified. This will prevent premature failure of the bushing and maintain ride comfort.

M. Some of the service procedures require the use of special tools designed for specific procedures. If you do not know how to safely use any of these tools, or do not have them, stop the project and consult a qualified mechanic. See “Tools and Supplies” on next page of this manual.

N. The required installation time for this system is approximately 8 hours for two people. Check off the box (☐) at the beginning of each step when you finish it. Then when you stop during the installation, it will be easier to find where you need to continue from.

O. Important information for the end user is contained in the consumer/installer information pack. If you are installing this system for someone else, place the information pack on the driver’s seat. Please include the installation instructions when you finish.

P. The lifespan of Rancho products depends on many factors. Improper use, abuse or harsh use in general may compromise the integrity of the suspension system and significantly reduce its lifespan. The suspension system is also subject to wear over time. Have the suspension system regularly inspected and maintained by qualified mechanics. If the inspection reveals any damage or excessive wear, no matter how slight, immediately replace or repair the component. The suspension system must be regularly maintained in order to optimize its safe and efficient use. The more severe the conditions under which the suspension system is operated, the more often it must be inspected and maintained.

Q. If any component breaks or bends, contact your local Rancho dealer or Rancho for replacement parts or, contact the Rancho Technical Department at 1-734-384-7804.

Thank you for purchasing the best suspension system available. For the best installed system, follow these instructions. If you do not have the tools or are unsure of your abilities, have this system installed by a certified technician. RANCHO IS NOT RESPONSIBLE FOR DAMAGE OR FAILURE RESULTING FROM AN IMPROPER INSTALLATION.
SPECIFICATIONS & REQUIREMENTS

Which Kit to Install

Before installing, make sure you have the correct kit.
Your truck came from the factory with one of three control arms installed:

Use Kit RS66301B for vehicles equipped with black forged steel.
Use Kit RS66302B for vehicles equipped with silver forged aluminum.
or
black stamped steel*

*NOTE: OE wheels not compatible with stamped steel control arms

Shock Absorbers

New Rancho shock absorbers must be used with this kit, and must be purchased separately.
Do not reuse OE shock absorbers, except with front shock spacer RS176714

⚠️ WARNING Use of the wrong shock absorbers can cause damage to vehicle without the damage being visible to you, resulting in loss of vehicle control and an accident

Required Rancho shock absorbers

Wheels and Tires

This suspension system was developed using the following tire & wheel combination:

- Tire: BFG KM2 LT325/60R20 Tires
- Wheel: 20" X 9" +10 offset wheel with 5.5" of backspacing.
- Total backspacing 6.0"
- Maximum total backspacing is 6.5". Before installing any other combination, consult your local tire and wheel specialist.

Recommended Components and Modifications

If front driveline vibration is present, replace front driveshaft with Powertrain Industries double cardan front driveshaft P/N 3194-9827. (Fits 5.3L V8 Automatic Only)
Consult driveshaft suppliers for other models

Rancho recommends Powertrain Industries driveshafts:

Powertrain Industries, Garden Grove, CA.
1-800-798-4585.

Tools and Supplies

Because of vehicle variations, this may not be a complete list.

**Diagram:**

- **Box 4 of 5:** Diagram showing components like shock spacers, washers, nuts, and Rancho decals.
- **Box 5 of 5:** Diagram showing steering knuckles for steel and aluminum control arms.
FRONT SUSPENSION

VEHICLE PREPARATION & SWAY BAR REMOVAL

1) Park the vehicle on a level surface. Set the parking brake and chock rear wheels. Measure and record the distance from the center of each wheel to the top of the fender opening. See Illustration 1.

2) Disconnect the sway bar from the lower control arms. Save end links for reuse.

3) Raise the front of the vehicle and support the frame with jack stands. Remove the front wheels and set them aside.

4) If applicable, remove the front skid plate and crossmember braces.

STEERING KNUCKLE, SHOCK ABSORBER, HALF SHAFT (4WD ONLY), & LOWER CONTROL ARM REMOVAL

1) Remove ABS sensor wire clips from the upper control arm and frame. Separate the ABS sensor wire plug at the frame. Remove the brake hose / ABS wire bracket from the frame and upper control arm, save bolt. See Illustration 2.

2) Remove the brake caliper anchor bolts. Remove the brake caliper and its mounting bracket as an assembly. Hang the caliper assembly with wire or a tie wrap.

   ! WARNING: Do not allow the caliper to hang by the brake hose. You could damage the hose, without this damage being visible to you, resulting in sudden and unexpected brake failure and an accident.

3) Label the brake rotor left or right. Remove rotor attachment torx screw. Remove the brake rotor.

4) Remove hub dust cap carefully using a small chisel and hammer to separate the edge of the cap from the hub. Work around the outer edge of the cap where it meets the hub.

5) Remove the axle nut using a 36mm socket.

   ! WARNING: Do not hammer the ball studs to separate them from components. You could damage the ball studs, without this damage being visible to you, resulting in sudden and unexpected failure of the ball studs and an accident.

6) Loosen tie rod jam nut.

7) Remove the nut from the outer tie rod ball stud. Using Kent-Moore Puller J-24319-B, separate tie rod stud from knuckle.

8) Loosen the nuts at the upper ball joint. Using Kent-Moore J-42188-B Ball Joint Separator, separate ball joints from knuckle.

9) Loosen the nuts at the upper and lower ball joints. Using Kent-Moore Ball Joint Separator Tool J-43631 and J-45851 Adapter, separate ball joints from knuckle.

10) Remove the upper and lower ball joint nuts. Carefully remove the steering knuckle.

11) Index mark the half shaft and front differential flange for installation reference. Illustration 3.

12) Remove the half shaft flange bolts. Remove the half shaft.
13) Index-mark the shock absorber upper mount, coil spring, and lower mount on the outward facing side. Disable Electronic Suspension Control connector if applicable.

14) Remove the shock absorber lower bolts. Remove the three shock absorber upper mount to frame nuts. Remove the shock absorber and spring assembly.

15) Remove the lower control arm pivot bolts. Remove the lower control arm.

16) Repeat steps 1 through 14 for the other side.

**FRONT DIFFERENTIAL REMOVAL (4WD ONLY)**

1) Remove the four bolts that attach the crossmember to the lower control arm rear pockets. Remove the crossmember.

2) Using a reciprocating saw or cutoff wheel, cut off the driver side crossmember bracket 3.5” from the inside edge. See Illustration 4. File or grind sharp edges and paint exposed metal. Repeat for passenger side crossmember bracket.

   **NOTE:** Frame coating can be removed with a putty knife and solvent such as mineral spirits.

   **WARNING:** Do not use a flame cutter or torch to remove bracket. You could warp, weaken or damage the bracket without the damage being visible to you, resulting in loss of vehicle control and an accident.

3) Reference mark the front driveshift U-joint to the differential yoke. Remove the four bolts and two retainers from the yoke and slide the shaft rearward to disengage. Tape the bearing cap assemblies and secure the shaft out of the way. See Illustration 5.

4) Disconnect the electrical connector from the passenger side, wiring harness from the top, and the vent hose from the driver side of the differential assembly. See Illustration 6 and Illustration 7.

5) Support the front differential assembly with adjustable jack stands or floor jack.

6) Remove the four mounting bolts. Carefully lower and remove the front differential.

   **NOTE:** The rear of the differential will have to be tilted down to clear the steering rack.

   **WARNING:** Do not damage the differential solenoid, or the steering rack plugs. You could damage the harness or plugs, without this damage being visible to you, resulting in sudden and unexpected steering failure and an accident.
7) Using a reciprocating saw or cutoff wheel, cut off the front lower flange of the differential. See Illustration 7 and Illustration 8.

**Front Differential Drop Bracket Installation (4WD Only)**

NOTE: When attaching differential drop brackets, face the open side of the bracket out and the larger end toward the front.

1) Loosely attach right drop bracket RS176713 to the passenger side differential frame mount with the original hardware. See Illustration 9.

2) Loosely attach left drop bracket RS176712 to the driver side differential frame mount with the original hardware. See Illustration 10.

3) With the help of an assistant, loosely attach the front differential to the installed drop brackets with the hardware from kit RS860550. Refer to Illustration 9 and Illustration 10. Install the larger USS washers on the passenger side axle tube mount.

**Subframe Installation**

1) Cut 15-3/8" off the rear of the front skid plate. Attach the front of the skid plate using OE hardware. Attach the cut end of the skid plate to the frame crossmember using OE hardware and RS176718 washers. Do not re-install metal cross-braces. See Illustration 11.

2) Attach aft brace brackets RS176160B to subframe with hardware from kit RS860743. Snug but do not fully tighten. See Illustration 16.

3) With the help of an assistant, raise the subframe up into the lower control arm frame brackets. Attach the subframe to the brackets with the original hardware. Insert the forward bolts from the front, and the aft bolt the rear. See Illustration 9.

4) Install OE cone washer under nut. Tighten the subframe to bracket bolts to 107 ft. lbs.

NOTE: If subframe contacts corners of front control arm frame brackets enlarge the inside corners using a round file or die grinder, See Illustration 12. Trim skid plate more if necessary.
DIFFERENTIAL INSTALLATION

1) ☐ Install two bushings (RS520041) from sub assy RS860821 into differential torque bracket RS176810B. Apply silicon lubricant and press sleeve RS420072 through the installed bushings.

2) ☐ Remove the 3 case bolts from the front of the differential. See Illustration 13.

NOTE: After removing the bolts, oil may seep from the case. Do not stop installation at this point.

3) ☐ Position bushings of differential torque bracket RS176810B in mount of subframe RS176819B.

4) ☐ Attach differential torque bracket RS176822 to the front differential with the 10mm hardware from kit RS860821. Use thread lock on bolts. Snug bolts to about 10 lb-ft.

5) ☐ Attach differential torque bracket RS176822 to subframe with 1/2" hardware from kit RS860821. Torque to 90 lb-ft.

6) ☐ Snug bolts attaching driver side diff drop to frame bracket and differential.

7) ☐ Snug bolts attaching passenger side diff drop to frame bracket and axle tube mount.

8) ☐ Torque bolts holding bracket RS176810B to differential case to 35 lb-ft.

9) ☐ Torque driver and passenger side differential drop bracket mounting hardware to 65 lb-ft starting with driver side.

⚠️ WARNING: Verify that the right drop bracket RS176713 or axle tube mount does not contact the steering rack or steering rack electrical connections. Failure to provide clearance could cause damage to the steering rack resulting in sudden and unexpected steering failure and an accident.

10) ☐ Reattach the differential electrical connector and install vent hose extension. Use wire ties to reattach wiring harness to differential. See Illustration 10 and Illustration 6.

11) ☐ Install skid plate RS176717 to subframe using 10mm hardware from kit RS860739. The slots in the skid plate should be perpendicular to the slots in the subframe. See Illustration 14.

12) NOTE: Skid plate and differential should have at least ¼" of clearance. If required, grind differential flange. See Illustration 8 and Illustration 9. Only grind protruding flange, DO NOT grind into differential housing.
**DRIVESHAFT INSTALLATION**

If front driveline vibration is present, replace front driveshaft with Powertrain Industries double cardan front driveshaft P/N 3194-9827. See Important Note P (page 4).

**OE Driveshaft Installation:**

1) □ Align reference marks and reattach the front driveshaft U-joint to the differential yoke using OE retainers and bolts. Tighten bolts to 22 ft. lbs. Blue Locktite is recommended on retainer bolts

**Double Cardan Driveshaft Installation:**

2) □ Loosen the clamp attaching the slip-yoke boot to the transfer case output shaft and slide boot forward off of output shaft.

3) □ Slide drive shaft slip-yoke forward out of transfer case.

4) □ If not yet installed, install and clamp boot on new driveshaft slip yoke. Install but do not tighten boot output shaft clamp.

5) □ Align one of the flat sides of the new driveshaft’s center yoke with the transmission linkage cable and slide slip yoke into transfer case output shaft. See Illustration 15

6) □ Attach the front driveshaft U-joint to the differential yoke using OE retainers and bolts. Tighten bolts to 22 ft. lbs. Blue Locktite is recommended on retainer bolts.

**AFT BRACE INSTALLATION**

1) □ Using a silicon spray, lubricate two bushings RS520041 and one sleeve RS420072 from kit RS860474. Press the bushings and sleeve into aft brace RS176132B as shown in Illustration 16.

2) □ Repeat step 1 to install the rest of the bushings and sleeves.

3) □ Loosely attach the aft braces to previously installed brackets on subframe RS176709B with the hardware from kit RS860474. See Illustration 16.
NOTE: Both aft braces should angle slightly outward from front to rear.

4) If applicable, remove the transfer case skid plate.

5) For 2WD vehicles, temporarily attach aft brace bracket RS176138 to the aft brace as shown in Illustration 16. Using the slotted hole in the bracket as a template mark the mounting hole location on the transmission crossmember. Drill a 1/2” hole at the marked location. Remove bracket. Repeat for other side.

6) Insert nut brackets RS176137 inside the crossmember as shown in Illustration 16. Align nut brackets over the drilled holes for 2WD vehicles and over the existing holes for 4WD vehicles.

7) Apply thread lock and insert a 1.00” bolt with washer from kit RS860474 through the slotted hole in bracket RS176138. Loosely attach bracket to crossmember by threading the bolt into the nut bracket. Repeat for other side.

8) Attach the aft braces to the installed brackets with the hardware from kit RS860474. See Illustration 16.

9) Tighten the aft brace mounting bolts to 80 FT-LBS then the bracket to crossmember and bracket to subframe bolts to 65 FT-LBS.

10) If applicable, cut the corner of the skid plate to avoid contact with the aft brace bracket. Reinstall the transfer case skid plate.

**SHOCK SPACER ASSEMBLY**

**FOR OE GMC SHOCK ONLY**

If replacing shock absorbers with Rancho shock absorber RS999832, RS7832, or RS55832, skip to next section - “SHOCK ASSEMBLY”

**SHOCK ASSEMBLY**

**FOR OPTIONAL RANCHO REPLACEMENT SHOCK ABSORBERS RS999832, RS7832, or RS55832**

If reusing OE shock absorber, proceed to next section - “LOWER CONTROL ARM AND SHOCK ABSORBER INSTALLATION”

**CAUTION:** Follow instructions and warnings supplied with shock absorber.

⚠️ **WARNING:** SPRING IS UNDER COMPRESSION LOAD WHEN INSTALLED. ATTEMPTS TO REMOVE SPRING WITHOUT PROPERLY RESTRaining THIS LOAD MAY RESULT IN INJURY. NEVER REMOVE THE CENTRAL LOCK NUT OF THE UPPER MOUNTING PARTS BEFORE THE SPRING IS COMPRESSED.

IF A SUITABLE SPRING COMPRESSOR TOOL IS NOT AVAILABLE, OR A QUALIFIED OPERATOR IS NOT AVAILABLE, MOST REPAIR SHOPS CAN SWAP THE COIL FOR A SMALL CHARGE.

1) Using a quality spring compressor, compress the coil spring until the tension is released from the shock absorber. See Illustration 18.

2) Remove the upper shock rod mounting nut. Slide the shock absorber out of the spring assembly.

3) Insert new shock absorber into spring assembly. Use index marks to align shock with the coil and upper mount. Install the original mounting nut. Tighten the nut to 22 ft. lbs.

4) Remove spring compressor.
LOWER CONTROL ARM AND SHOCK ABSORBER INSTALLATION

1) ☐ Loosely attach the lower control arms to the subframe with the hardware from kit RS860546. ALL BOLTS MUST GO IN FROM FRONT OF VEHICLE! Refer back to Illustration 9.

2) ☐ Loosely attach new Rancho shock absorber with OE hardware, or shock spacer and OE shock assembly using hardware supplied in kit RS860746, to upper shock mount.

3) ☐ Attach the shock absorber lower mount to the lower control arm with original hardware.

4) ☐ Snug all hardware, and then tighten upper shock and shock spacer hardware to 33 ft lbs, and lower shock mounting bolts to 44 ft lbs.

HALF SHAFT & STEERING KNUCKLE INSTALLATION

1) ☐ Remove the hub, splash guard, and ABS wire and bracket from the driver side steering knuckle. Transfer parts to driver side steering knuckle RS176710 as shown in Illustration 19.

2) ☐ Apply thread lock to bolts. Attach the hub, splash guard and ABS wire steering knuckle RS176710 with the original hardware. Tighten the hub mounting bolts to 133 ft. lbs. Attach ABS wire to knuckle with the loop strap from kit RS860547.

3) ☐ Loosely attach driver side steering knuckle RS176710 to the lower ball joint with the original hardware.

4) ☐ Insert the half shaft into the hub. Swing knuckle up to align with upper ball joint and half shaft to align with axle flange (half shaft can rest on lower control arm). Pull or pry upper control arm down to insert upper ball joint stud through knuckle and loosely attach with OE hardware. Tighten the nut on the lower ball joint stud to 74 ft. lbs., and the nut on the upper ball joint stud to 37 ft. lbs. See Illustration 20.

5) ☐ Place axle spacer RS176235 against the driver side differential flange. Align flange marks and place the half shaft flange against the spacer. Apply thread lock to bolts and attach the half shaft to the differential with the hardware from kit RS860176. See Illustration 21. Tighten the flange bolts to 58 ft. lbs.

6) ☐ Install the half shaft washer and nut. Tighten nut to 165 ft. lbs.

7) ☐ Remove outer tie rod end from inner tie rod. Leave jam nut on tie rod.

8) ☐ Using cut-off wheel, cut 5/8” (.625”) off of inner tie rod. Deburr cut and remove jam nut to clean threads. Thread jam nut back onto inner tie rod end. See Illustration 22.

If jam nut does not spin off of tie rod by hand, more de-burring may be needed.
9) Using a cut-off wheel or saw, cut 1/2" (.50") off of OE outer tie rod end. Deburr with countersink or deburring tool. See Illustration 22.

10) Thread OE outer tie rod end onto inner tie rod. Outer tie rod end should thread easily onto inner tie rod. Take care not to cross-thread.

11) Leave 1/2" of exposed thread on tie rod and snug jam nut and outer tie rod end. See Illustration 22.

12) Attach tie rod end to steering knuckle RS176710 with OE nut. Tighten ball stud nut to 33 ft. lbs. Tighten jam nut to 22 ft. lbs. See Illustration 22.

13) Install the brake rotor and rotor attachment torx screw. Apply thread lock and attach the caliper to the knuckle with the original mounting bolts. Tighten the caliper mounting bolts to 129 ft. lbs.

14) Repeat steps 1 through 8 for passenger side.

**Brake Line Drop Bracket Installation**

1) Install driver side brake line drop bracket RS176915 to upper control arm pocket using OE and supplied ¼" hardware from kit RS860738. See Illustration 23.

2) Attach brake OE brake hose bracket to brake line drop bracket with supplied ¼" hardware from kit RS860738. Bolt head must face to the front of the vehicle to allow clearance with upper control arm. Insert ABS wire clip in brake line drop bracket and frame. See Illustration 23.

3) Repeat steps 1 and 2 on passenger side with brake line drop bracket RS176916.

**Sway Bar Drop Bracket Installation**

1) Using the washers and shorter M10x30mm bolts from hardware kit RS860547, loosely attach the sway bar drop brackets RS176579 to the frame rails at the original sway bar location. See Illustration 24.

2) Using the washers and nuts from hardware kit RS860547, and OE bolts, loosely attach the sway bar to drop brackets RS176579.

3) Loosely attach the sway bar end links to the lower control arms with the original end link assemblies.

NOTE: If unable to attach sway bar to lower control arm, wait until the vehicle is on the ground at ride height.

4) Tighten all sway bar drop bracket mounting bolts to 45 ft. lbs. Do not tighten sway bar end links to lower control arm.

**Lower Vehicle**

1) Install front wheels and lower vehicle to ground. If reinstalling OE wheels use ¼" wheel spacers RS176737 (see important note M). Tighten the lug nuts to 140 ft. lbs.

2) Tighten the lower control arm pivot bolts to 107 ft. lbs. Tighten the sway bar end link bolts to 22 ft. lbs.
RISER BLOCK INSTALLATION

1) □ Chock front wheels. Raise the rear of the vehicle and support the frame with jack stands. Remove the rear wheels.

2) □ Separate four ABS wire clips from frame and axle. Remove clips from wires.

3) □ Separate ABS sensors from axle by removing torx bolts and sliding sensor out of axle. The passenger side brake hose bracket may need to be separated from the parking brake bracket to remove passenger side ABS sensor.

4) □ Separate top and bottom halves of brake hose bracket at top of differential. See Illustration 25.

5) □ Remove both fore and aft parking brake hanger brackets from frame. See Illustration 26.

6) □ Support the rear axle assembly with a floor jack. Remove both rear shock absorbers. Do not reuse OEM shock absorbers.

7) □ With the axle still being supported, remove the anchor plate and U-bolts from driver side. See Illustration 27.

8) □ Loosen passenger side U-bolt nuts two turns each.

WARNING: Do not allow the axle to hang by any hoses or ABS cables. You could damage the hoses or ABS cables, without this damage being visible to you, resulting in sudden and unexpected failure of a hose or ABS system, and an accident.

9) □ Carefully lower the rear axle and remove the original riser block. Do not allow the axle to hang by any hoses or cables.

10) □ Place the new riser block RS15113 pin side down on the axle pad with the offset top hole and taller end of the block to the rear. See Illustration 28.

11) □ Raise the axle assembly until the riser block contacts the
helper spring. Be sure to align the hole in the block with the head of the center bolt.

**NOTE:** If necessary, CAREFULLY loosen the passenger side U-bolt nuts another 1-2 turns. Do not allow axle to twist or sway.

12) Reinstall the U-bolt spacer on top of the leaf spring. Attach the spring to the axle with the NEW U-bolts RS7486, original anchor plate and spacer, and hardware from kit RS8102. Snug the nuts down but do not tighten. See Illustration 29

![Illustration 29](image)

13) Repeat steps 7 through 12 for the other side.

14) Cross tighten the U-bolt nuts evenly to 89 ft. lbs. Recheck the torque on the center bolt.

15) Install new Rancho shock absorbers or relocater kit RS6202. Tighten hardware to 85 ft. lbs.

**BUMP STOP SPACER INSTALLATION**

1) Remove the bolt holding the bump stop to the frame bracket. Remove the bump stop.

2) Place bump stop spacer RS176477 against frame bracket. Attach original bump stop to spacer with the 10mm hardware from kit RS860582. See Illustration 30.

![Illustration 30](image)

3) Repeat steps 1 and 2 for the other side.

**BRAKE LINE BRACKET INSTALLATION**

1) Remove the lower half of the brake hose bracket from top of differential housing. Attach the new brake line bracket RS176722 to the rear differential with the OE hardware. See Illustration 31.

![Illustration 31](image)

2) Carefully reshape the OE hard brake lines and twist the plastic brake line retainers on the axle to allow OE brake line bracket to attach to RS176722. Attach the upper brake hose bracket to the top of bracket RS176722 using the 5/16” hardware from kit RS860750.

3) Remove the driver side (lower) parking brake cable from the aft OE parking brake hanger wire.

4) Reinstall both fore and aft OE parking brake hanger wires. See Illustration 32.

![Illustration 32](image)
1) □ Turn the front wheels completely left then right. Verify adequate tire, wheel, and brake hose clearance. Inspect steering and suspension for tightness and proper operation.

2) □ With the suspension at maximum extension (full droop), inspect and rotate all axles and driveshafts. Check for binding and proper slip yoke insertion. The slip yoke should be inserted a minimum of one inch into the transfer case and/or transmission.

3) □ Ensure that the vehicle brake system operates correctly. If new brake hoses were installed, verify that each hose allows for full suspension movement.

4) □ Install rear wheels and lower vehicle to ground. Tighten lug nuts to 140 ft. lbs.

5) □ Readjust headlamps. Have vehicle Aligned at a certified alignment facility.

Recommended Alignment Specifications
Caster (degrees): 4.5° ± 1.0°
Camber (degrees): 0° - neg .3°
Sum Toe In (degrees): .1° ± .2°

⚠️ WARNING: Original factory equipped (OE) wheels and spare 17" and up with OE tires require the use of ¼" wheel spacer RS176737 when used on the front of the vehicle. Do not use spacers on the rear wheels. Keep spacers and instructions in vehicle for use with OE spare.
